

LMA Registration Number	
Aircraft Type / Name	
Aircraft Classification	Fixed Wing Power / Powered Glider / Pure Glider / Helicopter / Multirotor
Work Type	Modification / Repair
Weighed MTOM (kg)	
Operator	
Builder / Repairer	
Inspector(s)	

This checklist shows the compliance of modification or repair to the model aircraft above in accordance with the design requirements that apply to large model aircraft being designed, constructed and flown under the LMA Over 25kg Scheme. Only the requirements impacted by the scope of the modification / repair need be considered and compliance recorded.

Inspection	Inspection Stage	Inspector Name	Inspector	Inspection Date
Number			Signature

3				

System / Structural Area to be	
changed or repaired	
Description of change or repair	

SUBPART A - GENERAL - No compliance statements needed

This column
Y, N or N/A
And inspection
number

SUBPART B – PERFORMANCE

DR-LMA-2000 Approved Operating Limitations

Test flights recommended of
Are any special operational limitations needed for the aircraft?

If so, define limitations-

DR-LMA-2100 Mass and centre of gravity		
Description of weighing and C of G measuring process carried out-		
Weighed MTOM (with all batteries & equipment fitted & all tanks full)	kg	
C of G position / range -		

SUBPART C – DESIGN AND CONSTRUCTION

DR-LMA-3000 Structural design loads	
DR-LMA-3010 Structural strength	
Are the loads on the aircraft structure appropriate to the aircraft type understood by the repair	
/ modification designer?	
Have all loads appropriate to the aircraft type been taken into account in the design of the	
aircraft repair / modification?	
Has the structure repair / modification been designed to be able to support limit and ultimate	
loads appropriate to the aircraft type?	
DR-LMA-3020 Structural durability	
Are any special inspections in addition to the standard annual inspection needed?	
If so, list here-	
DR-LMA-3100 Aeroelasticity	
How is flutter planned to be controlled (e.g. control surfaces mass and / or aerodynamically	
balanced, minimised free play, sufficiently powerful servo(s))?	
Is the free play on all control surfaces minimised?	
Are all servos and control linkages adequality stiff and strong?	
Is the structure and are all control surfaces adequately stiff?	
DR-LMA-3200 Design and construction principles	
Summary of the modification / repair structural design-	
Is the detail design and construction of the aircraft modification / repair of an appropriate	
quality?	
Impression of construction quality-	

Are all access panels, doors and canopies designed to not open in flight?	
DR-LMA-3210 Protection of structure	
If needed, is the structure protected (e.g. wooden seaplane varnished internally)?	
Is maintenance access possible to all parts and structure that may need maintenance?	
Does sufficient clearance exist between the structure and moving parts?	
DR-LMA-3220 Materials and processes	
Wooden Structure Modification / Repair	
Brief Description of the wooden modification/ repair process-	
Are the wood types used appropriate, with grain direction appropriate, free of knots and other	
defects?	
List wood types used-	
List adhesives used-	
Are all bonded joints of an appropriate quality?	
Composite Structure Modification / Repair	<u> </u>
Brief Description of the composite modification/ repair process-	
brief bescription of the composite mounication, repair process	
Are the cloths, fibres and resins used compatible?	
Are the cloths, fibres and resins used compatible? List cloths, fibres and resins used-	
List cloths, fibres and resins used-	
List cloths, fibres and resins used- Are all parts properly made, with no dry spots or excessive resin?	
List cloths, fibres and resins used- Are all parts properly made, with no dry spots or excessive resin? Are fibre direction(s) and the layup of laminations appropriate for the parts?	
List cloths, fibres and resins used- Are all parts properly made, with no dry spots or excessive resin? Are fibre direction(s) and the layup of laminations appropriate for the parts? Are core materials (foam, honeycomb, balsa etc) appropriate and appropriately oriented &	
List cloths, fibres and resins used- Are all parts properly made, with no dry spots or excessive resin? Are fibre direction(s) and the layup of laminations appropriate for the parts? Are core materials (foam, honeycomb, balsa etc) appropriate and appropriately oriented & located for the parts?	
List cloths, fibres and resins used- Are all parts properly made, with no dry spots or excessive resin? Are fibre direction(s) and the layup of laminations appropriate for the parts? Are core materials (foam, honeycomb, balsa etc) appropriate and appropriately oriented & located for the parts? Are all bonded joints of an appropriate quality?	
List cloths, fibres and resins used- Are all parts properly made, with no dry spots or excessive resin? Are fibre direction(s) and the layup of laminations appropriate for the parts? Are core materials (foam, honeycomb, balsa etc) appropriate and appropriately oriented & located for the parts? Are all bonded joints of an appropriate quality? Metallic Structure Modification / Repair	
List cloths, fibres and resins used- Are all parts properly made, with no dry spots or excessive resin? Are fibre direction(s) and the layup of laminations appropriate for the parts? Are core materials (foam, honeycomb, balsa etc) appropriate and appropriately oriented & located for the parts? Are all bonded joints of an appropriate quality?	
List cloths, fibres and resins used- Are all parts properly made, with no dry spots or excessive resin? Are fibre direction(s) and the layup of laminations appropriate for the parts? Are core materials (foam, honeycomb, balsa etc) appropriate and appropriately oriented & located for the parts? Are all bonded joints of an appropriate quality? Metallic Structure Modification / Repair	
List cloths, fibres and resins used- Are all parts properly made, with no dry spots or excessive resin? Are fibre direction(s) and the layup of laminations appropriate for the parts? Are core materials (foam, honeycomb, balsa etc) appropriate and appropriately oriented & located for the parts? Are all bonded joints of an appropriate quality? Metallic Structure Modification / Repair	
List cloths, fibres and resins used- Are all parts properly made, with no dry spots or excessive resin? Are fibre direction(s) and the layup of laminations appropriate for the parts? Are core materials (foam, honeycomb, balsa etc) appropriate and appropriately oriented & located for the parts? Are all bonded joints of an appropriate quality? Metallic Structure Modification / Repair	
List cloths, fibres and resins used- Are all parts properly made, with no dry spots or excessive resin? Are fibre direction(s) and the layup of laminations appropriate for the parts? Are core materials (foam, honeycomb, balsa etc) appropriate and appropriately oriented & located for the parts? Are all bonded joints of an appropriate quality? Metallic Structure Modification / Repair	
Are all parts properly made, with no dry spots or excessive resin? Are fibre direction(s) and the layup of laminations appropriate for the parts? Are core materials (foam, honeycomb, balsa etc) appropriate and appropriately oriented & located for the parts? Are all bonded joints of an appropriate quality? Metallic Structure Modification / Repair Brief Description of the metallic modification/ repair process-	
Are all parts properly made, with no dry spots or excessive resin? Are fibre direction(s) and the layup of laminations appropriate for the parts? Are core materials (foam, honeycomb, balsa etc) appropriate and appropriately oriented & located for the parts? Are all bonded joints of an appropriate quality? Metallic Structure Modification / Repair Brief Description of the metallic modification/ repair process-	

Does the modification / repair design account for material variability of all materials used and the effect on materials from the operating environment? If any critical modification / repair processes are used are they understood and controlled / recorded appropriately?	
the effect on materials from the operating environment? If any critical modification / repair processes are used are they understood and controlled /	
If any critical modification / repair processes are used are they understood and controlled /	
i cooi aca appropriately.	
Briefly describe process and if necessary attach copy of process & records-	
Are the types and grades of fasteners used in the structure appropriate for their intended use	
and loading?	
Is the covering applied to the structure appropriate to the aircraft type and applied to an	
appropriate quality? Describe covering materials used-	
DR-LMA-3330 Transportation, reconfiguration and storage	
Are any special maintenance actions / inspections in addition to the standard maintenance	
schedule needed?	
If so list here-	
Does the design prevent the aircraft from being assembled incorrectly?	
DR-LMA-3400 Landing Gear systems	
Is the design and construction of the landing gear adequately robust and strong for the intended	
operation of the aircraft?	
Summary of landing gear design and construction materials, including wheels tyres and brakes-	
Do steering wheel(s) steer positively with a sufficiently robust steering mechanism?	
Does the landing gear retract and extend without jamming and positively lock in the takeoff /	
landing position?	
Retraction mechanism type & power-	
Mr	
Brake power source- Do the brakes work reliably and symmetrically?	
Brake power source- Do the brakes work reliably and symmetrically? DR-LMA-3410 Buoyancy for UA for take-off and landing on water	
DR-LMA-3410 Buoyancy for UA for take-off and landing on water	
DR-LMA-3410 Buoyancy for UA for take-off and landing on water If intended for operations on water does the aircraft have sufficient buoyancy to support take- off and landing in water conditions? DR-LMA-3500 Protection Against High Energy Electrical Sources	
DR-LMA-3410 Buoyancy for UA for take-off and landing on water If intended for operations on water does the aircraft have sufficient buoyancy to support take- off and landing in water conditions?	
DR-LMA-3410 Buoyancy for UA for take-off and landing on water If intended for operations on water does the aircraft have sufficient buoyancy to support take- off and landing in water conditions? DR-LMA-3500 Protection Against High Energy Electrical Sources	
DR-LMA-3410 Buoyancy for UA for take-off and landing on water If intended for operations on water does the aircraft have sufficient buoyancy to support take- off and landing in water conditions? DR-LMA-3500 Protection Against High Energy Electrical Sources If LiPo batteries of more than 12S fitted (or other batteries greater than 50v DC) are fitted, are adequate warnings and appropriate shielding installed? DR-LMA-3600 Fire protection	
DR-LMA-3410 Buoyancy for UA for take-off and landing on water If intended for operations on water does the aircraft have sufficient buoyancy to support take- off and landing in water conditions? DR-LMA-3500 Protection Against High Energy Electrical Sources If LiPo batteries of more than 12S fitted (or other batteries greater than 50v DC) are fitted, are adequate warnings and appropriate shielding installed? DR-LMA-3600 Fire protection Are fuel tanks & fuel lines located and routed clear of hot exhausts and similar hot parts that	
DR-LMA-3410 Buoyancy for UA for take-off and landing on water If intended for operations on water does the aircraft have sufficient buoyancy to support take- off and landing in water conditions? DR-LMA-3500 Protection Against High Energy Electrical Sources If LiPo batteries of more than 12S fitted (or other batteries greater than 50v DC) are fitted, are adequate warnings and appropriate shielding installed? DR-LMA-3600 Fire protection	

DR-LMA-3700 Design and construction information	
If changed, are aircraft general arrangement, flight control system, powerplant system and	
energy storage system diagrams available (and attached to this inspection record)?	
DR-LMA-3800 UA Marking	
Is the aircraft structure indelibly marked with the LMA registration number in the format LMA-	
XXXX (where XXXX is the LMA registration number of the aircraft)?	
Registration number location –	

SUBPART D - POWER PLANT INSTALLATION

DR-LMA-4000 Powerplant system	
DR-LMA-4100 Powerplant operating characteristics	
Powerplant details: number of: Capacity / power / thrust	
petrol / turbine / electric / other	
Powerplant system batteries: at: Ah of: Cells / Volts	
Battery Type / chemistry:	
Are engines / motors of appropriate power / thrust for the aircraft without excessive	
overpowering?	
Are engines / motors mounted appropriately in and to the structure?	
Are engine exhausts mounted and routed appropriately in the structure?	
Are engine / motor controllers mounted appropriately in the structure?	
Are protections in place to stop any engine / motor from starting unexpectedly?	
Can every engine / motor be shut down or reduced to idle power in flight?	
Do all engines / motors run at all power settings controllably and without excessive vibration?	
Propellor type / size Diameter Pitch Material Attachment Type	
DR-LMA-4200 Powerplant energy storage and distribution systems	
Note – This applies to the stored energy (liquid fuel / electricity) for the engines(s)	
Are fuel tanks / batteries mounted appropriately in the structure?	
Are fuel lines / electrical wiring routed and installed appropriately in the structure?	
Are electrical connectors of an appropriate size / rating for the power to be supplied?	
Are adequate fuel filters fitted in an appropriate location in the system and mounted	
appropriately?	
Are any valves or other components fitted in an appropriate location in the system and	
mounted appropriately?	
Energy Type: Petrol / Kerosene / Batteries / Other	
Quantity of Stored Energy: Litres / Ah at: Cells / Volts / Other:	

SUBPART E – SYSTEMS AND EQUIPMENT

DR-LMA-5000 UAS level system requirements	
Are all the systems needed for safe flight which are covered in more detail in the flowing	
sections designed and installed adequately for their intended function?	
Are there any additional systems required for safe flight not covered in the flowing sections?	
If so describe here-	

inspection record a compliance checking thin cost is is a	,
Are and additional systems needed for safe flight designed and installed adequately for their intended function?	
Do any systems not needed for safe flight (e.g. bomb doors, lights) operate without causing a risk to the aircraft or uninvolved people / property?	
DR-LMA-5100 UAS power supply, generation, storage, and distribution	
Note – This applies to the stored power (electricity) for the onboard flight control / radio system	า
Is all power supply wiring of an appropriate type and gauge and adequately routed?	
Are all switches and connectors appropriate for the expected load and appropriately installed?	
If one power supply fails during flight, will the remaining supply have adequate capacity and	
voltage / current capability for the remainder of a flight?	
Can the failure of one power supply be detected before or during a flight?	
Number of batteries: at: Ah of: Cells / Volts Battery Type / chemistry:	
DR-LMA-5200 UA Flight Control System	
Does The flight control system diagram identify all servos, receivers and other equipment with their model numbers?	
Is the overall design and installation of the flight control system (e.g. servos, receivers)	
appropriate to the aircraft and the intended operations?	
Is all flight control equipment adequately installed and cables appropriately sized and routed?	
Are all connectors used appropriate for the electrical load and secured against disconnection?	
Are all mechanical parts of the flight control system adequate for their task and adequately	
installed?	
Flight control frequency and output power: 2.4GHZ, 100mW / 868MHz, 25mW /	
Other –	
Does the failsafe meet the minimum requirement of preventing the aircraft from leaving the	
defined flying area in case of loss of radio control link?	
Describe failsafe action-	
Has failsafe operation been checked by turning the transmitter off with engine(s) / motor(s)	
running?	
DR-LMA-5300 Pressurised systems elements	Т
If compressed air systems are used, are the pressure reservoirs and piping adequate or	
commercially available parts used and all parts installed appropriately?	
Are any other pressurised systems are used, are they capable of withstanding appropriate	
operational and environmental pressures?	
DR-LMA-5400 Flight data recorder	
Is the aircraft fitted with a flight data recording system that records the GPS time/ date and the speed and 3-dimensional position of the UA at least every 2 seconds?	
Has the data recorder been tested and shown to be recording the correct data?	

SUBPART F - REMOTE PILOT CONTROLS

DR-LMA-6000 Remote Pilot Controls (Performance)	
DR-LMA-6100 Remote Pilot Controls (Human Factors)	
Is the radio control transmitter adequate for the type of flying operations envisaged?	
Are the transmitter controls set up so that the pilot can safely operate the aircraft?	
Are any telemetry alarms only for flight critical values?	

Transmitter make & model-	
If other pilot controls are provided (such as a ground control station) are they adequate for the	
type of flying operations envisaged and set up so that the pilot can safely operate the aircraft?-	

SUBPART G – UAS INFORMATION

DR-LMA-7000 Aircraft Information	
Is the standard maintenance schedule being used with additional inspections / maintenance	
required for the intended operations identified?	
Is the maintenance schedule to be used attached to this checklist?	

Final Inspection Checklist				
Items to be visually checked during final inspection before first flight post modification / repair as a final				
confirmation that the aircraft is completed and is ready for flight. This is intended as a thorough pre-				
flight check and not a complete re-inspection				
Structure	Powerplant & Energy Storage Installation			
Internal structure	Fuel system, ignition system, exhaust system,			
External structure and covering	engine controls			
Control surfaces and hinges	Engine / motor mounts			
Structural joints	Batteries, wiring, connectors			
Flight Controls	Landing Gear			
Receivers antenna orientation	Assembly and fittings			
Servo wiring routing and security, power	Brake system			
wiring routing and security	Hoses and pipes			
Batteries and switches	Wheels and tyres			
Servo attachments, hinges, brackets, push	Nose / tail wheel steering operates in correct			
rods, bell cranks, control horns, balance	sense			
weights, cables, pulleys, fairleads	Retraction / extension check			
Full and free movement in correct sense of	Aircraft LMA ID marked			
all controls, including any trim tabs				
Failsafe operation checked	Operator ID marked			
Engine(s) ground run	Inspection Record Completed with all			
	attachments			

I have inspected the aircraft above and confirm by signing below that as far as can be reasonably ascertained the modification / repair to the aircraft complies to a satisfactory standard with all the applicable requirements listed above in accordance with the LMA Over 25kg scheme and can proceed to flight testing.
